

Nitra Design Challenge:

Social Media Integration Dashboard

User

This product is designed for business users who manage their company’s social media presence.

Product Description

Your company provides a marketing automation platform that helps businesses connect and manage their social media accounts (e.g., Twitter, LinkedIn, Instagram) in one place.

Each connected account allows users to schedule posts, view engagement metrics, and manage authentication tokens through third-party APIs.

However, each social media provider has **unique integration rules and technical limitations**, which your platform must clearly communicate and handle through UI design.

Platform Rules

Platform	Rules
Twitter	Users can connect multiple Twitter accounts. Each requires OAuth authentication.
LinkedIn	Users can connect only one company page at a time. Must remove the existing account to switch.
Instagram	Users can connect up to two accounts, but only one can be set as “Primary.”

Shared Rules

- Each platform connection is authenticated through its own API (OAuth or token).
- If authentication expires, users must reconnect their accounts.

Task

Design a Social Accounts Settings page (web interface) that allows users to:

1. Connect, view, and manage accounts from multiple social media providers.
2. Support future scalability as more platforms are added.

Explain Your Design Thinking

Please include a short explanation describing your reasoning:

- How do you structure the UI to make each provider's rules clear?
- How do you prevent user errors or confusion?
- What design patterns do you use to maintain scalability?
- How does your system handle edge cases (e.g., expired tokens, multiple roles)?

Timeline

You have **1 week** to complete this assignment.

Deliverables

Please submit:

1. **High-fidelity** mockups of the Social Accounts Settings page
2. User flow or interaction diagram (optional but encouraged)
3. Design rationale or written explanation of your approach

Evaluation Criteria

Area	What We're Looking For
Design Thinking	Does the rationale show systematic reasoning and scalability?
Information Architecture	Is the structure clear and adaptable to more providers?
Interaction Design	Are the flows logical and error-preventive?
Visual Design	Is the interface aesthetically pleasing, consistent, and easy to scan?
Component Utilization	Does the design use appropriate and common B2B platform components correctly?

Important Notice

The submitted design challenge will be used **solely for interview evaluation purposes**.

All materials and ideas you provide will **not be used, replicated, or implemented** in any Nitra product or project.

This exercise is intended purely to understand your **design process, decision-making, and problem-solving approach**.
